Abstract

This paper presents the simulation and experimentation of Z-source Cascaded Multilevel Inverter (CMLI) for a Photo Voltaic (PV) generator feeding an isolated load. In the proposed method each H-bridge of conventional CMLI is connected to a string of PV panels via Z-source network named Boost Cascaded Multi Level Inverter (BCMLI). The proposed system focus on the efficient utilization of PV arrays, achieving minimum harmonic distortion, reduced switching stress and reduced filter circuit arrangements. The proposed configuration boost up the PV array voltage and generate high quality AC power for domestic and industrial applications. To achieve better quality of power, Multi Carrier Sinusoidal Pulse Width Modulation (MCSPWM) control scheme is introduced for inverter switching strategy. The proposed system is compared with conventional Z-Source Inverter (ZSI) based PV systems and its performance has been obtained using MATLAB/SIMULINK models. Prototype hardware model of 5-Level BCMLI configuration is developed and its output results are validated.

Background In phenylketonuria (PKU), weaning is considered more challenging when compared to feeding healthy infants. The primary aim of weaning is to gradually replace natural protein from breast milk or standard infant formula with solids containing equivalent phenylalanine (Phe). In addition, a Ph...

The Quasi-impedance source inverters/Quasi-Z source inverters (Q-ZSIs) have shown improvement to overwhelmed shortcomings of regular voltage-source inverters (VSIs) and current-source inverters (CSIs) in terms of efficiency and buck-boost type operations. The Q-ZSIs encapsulated several signific...
